

National Cyber Security Centre Alert

On Friday 17th May the NCSC released an [Alert](#) on its website relating to a SharePoint vulnerability. NCSC have also previously pushed this out via CiSP. The Alert can be accessed here: <https://www.ncsc.gov.uk/news/alert-microsoft-sharepoint-remote-code-vulnerability>

Microsoft published details of this vulnerability (CVE-2019-0604), which allows an attacker to run arbitrary code by uploading a specifically crafted SharePoint application package. Successful exploitation of the vulnerability could allow an attacker to gain access to sensitive data, enable lateral movement within a network and potentially use the access to target an organisation's customers and suppliers.

NCSC say they are seeing a concerning level of large organisations falling victim to this vulnerability from a wide range of sectors. **NCSC have seen this vulnerability enable deep lateral movements within large networks.**
